Sequence 1290, Application US/09198452A
Patent No. 6595294
Patent No. 6559204
Patent No. 6559204

GENERAL INFORMATION:
APPLICANT: Griffais, R.
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, prever TITLE OF INVENTION: and treatment of infection
FILE REFERENCE: 9710-003-999
CURRENT PELING DATE: 1998-11-24
NUMBER OF SEQ ID NOS: 6849
SEQ ID NO 1290
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          APPLICANT: GUEGLER, Karl J.

10S-09-601-478-5

Sequence 5, Application US/09601478

Patent No. 6403785

GENERAL INFORMATION:

APPLICANT: OSTUKA PHARMACOUTICAL CO., Ltd.

TITLE OF INVENTION: Human TSC403 gene and human INGIL gene

FILE REFERENCE: Q60193

CURRENT APPLICATION NUMBER: US/09/601,478

CURRENT PILING DATE: 2000-08-03

PRIOR PRICA PAPLICATION NUMBER: JP H10-134679

PRIOR FILING DATE: 1998-03-05

PRIOR FILING DATE: 1998-03-05

PRIOR FILING DATE: 1998-03-05

PRIOR FILING DATE: 1998-02-03

NUMBER OF SEQ ID NOS: 11

SEQ ID NO S

LENGTH: 280

TURNOR: DATE

This is the amino acid sequence of human mature phosphatidic acid phosphataae-beta (PAP-beta), an enzyme that catalyses the conversion of phosphatidic acid into diacylglycerol. 3 Variants of human PAP, i.e. PAP-alpha 1 and 2 (see AAW79284-85), PAP-beta (see AAW79286) and PAP-gamma (see AAW79287) have been identified. The invention provides PAP-gamma (polymephotides (see AAW79286-89) and polymephides. A method of preparing PAP in a transformed host cell, and a method of using PAP to dephosphorylate a substrate, especially lysophosphatidic acid, ceramide 1 phosphate or sphingosine 1-phosphate, particularly for production of canorylglycerol, but also monoacylglycerol, ceramide and sphingosine. PAP is able to control the balance of lipid mediacors of cellular activation and signal transduction. Sequences that encode PAP are potentially and signal transduction. Sequences that encode PAP may be tumour suppressors, PAP-alpha is expressed at lower levels in cancer cells than an encode and diabetes-

The invention relates to tau-related polypeptide consisting essentially of an amino acid sequence selected from PPAP2A, PPAP2B, IHPKI, IHPK3, IHPK2, FLJ20530, DJ434014.5, EZFI, LCol127424, LCol13119 and KIAA0826 (ADM72102-ADM72112 respectively). The methods and compositions of the present invention are useful for the diagnosis and/or treatment of neurological diseases or conditions associated with aberrant expression or activity of the Tau-related polypeptide, such as Alzheimer's disease and Parkinson's disease. The present sequence represents a human tau-related polypeptide homologue PPAP2B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New PRO nucleic acid or polypeptide, useful for preparing a pharmaceutical composition for diagnosing or treating psoriasis in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Schoenfeld J, Williams PM,

The invention discloses a composition comprising two or more isolated rate or human polymuclectides or a polymuclectide which represents a fragment, cor human polymuclectides or a polymuclectide which represents a fragment, cor derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the movel polymuclectide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain, and a sequence that is differentially expressed in neuronal tissue of a first animal cubjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound for identifying a compound or small molecule that regulates the activity of one or more of the compound for identifying a compound useful in treating compound for identifying a compound useful in treating compound that a polymetides or their antibodies. The polypeptides given in the specification, a method for identifying a compound useful in treating complypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating colypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating colypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating colypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is a variation or an animal or sequence data for this patent did not form mark of the printed for this patent did not form mark of the printed polymucleotice. The sequence data for this paten
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Phosphatase polypeptides and encoded polynucleotides with substrate-specificity for prenylphosphoric acid, applicable in mass-production of all-trans-prenyl alcohols by culturing transformants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel phosphatase polypeptide, exhibiting substrate-specificity for not less than 15C prenylphosphoric acid. The polynucleotides and encoded polypeptides are applicable in mass-production of all-trans-prenyl alcohols. The sequence represents a rat phosphatase polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGT) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cativity of (II) as useful in gene therapy techniques to restore normal activity of (II) to to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the contraction of the printed specification, but was obtained in the contraction of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                               Human, chromosome mapping; gene mapping; gene therapy, forensic, food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 20; SEQ ID NO 53793; 103pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               electronic format directly from WIPO at

WPI; 2001-589934/66. N-PSDB; AAS45153 Novel polypeptides and nucleic acids obtained from cDNA libraries prepared from various human tissues, for diagnosis and treatment of cancer, neurological, inflammatory, and autoimmune disorders.

Example 2; SEQ ID NO 610; 107pp; English.

The invention relates to novel isolated human secreted polypeptides (I) and polynucleotides (II). (I) and (II) are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses, and is involved in increasing heematopoiesis, stem cell survival, bone growth and remodeling. (I), (II) and modulators of (II) are useful for prophylaxis or treatment of one or more cancers. (II) is also useful for creating transgenic animals useful for studying the in vivo activities of the polypeptide as well as for studying modulators of the polypeptides. (I) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, cerivity, regulation of hamatopoiesis and is useful for treating myeloid activity, regulation of hamatopoiesis and is useful for treating myeloid and for regeneration of home, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, ulcers, for treating osteoporosis, osteoarthritis, bone degenerative disorders, corperidontal disease. Purthermore, (I) is also useful for reperfusion injury in various tissues, various immune deficiencies and for reperfusion injury in various tissues, various immune deficiencies and for functions and treatment of multiple solutions. fungal infections, autoimmune disorders e.g. multiple sclerosis, rheumatoid arthritis, diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems. In addition, (I) affects biortythms or circadian cycles of rhythms, fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune response. AAU28020-AAU28395 represent novel human secreted protein σ

                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antiniflammatory, neuroprotective, antianaemic, cytostatic and vulbnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoietic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic contig protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zhang J, Wehrman T, Wang Z, Ma Y;

The invention relates to an isolated NOVX polypeptide (of 44 disclosed) comprising its mature form, a sequence having at least 95% sequence conditions in the amino acid sequence or more conservative substitutions in the amino acid sequence of NOVX. Also included are a composition comprising NOVX and a carrier, a kit comprising, in one or conservative containars, the composition, a method of identifying an agent that binds to NOVX, a method for identifying a potential therapeutic agent for aberrant physicolaid interactions of NOVX, a method for screening or activity of or of latency or precisposition to a pathology cassociated with NOVX, a method for screening or preventing a pathology associated with NOVX, a method for preventing a pathology associated with NOVX or a pathological state in a mammal, an isolated nucleic acid molecule, call comprising the vector, an antibody that immunospecifically binds to NOVX protein , a vector comprising the nucleic acid molecule or a call comprisising the vector; an antibody that immunospecifically binds to preventising the vector; an antibody that immunospecifically binds to prevend of the determining the presence or amount of NOVX or the nucleic acid molecule in a sample, a method for determining the presence of or predisposition to a disease associated with altered levels of expression of NOVX or the nucleic acid molecule in a sample, and though the presence or amount of NOVX or the nucleic acid molecule acid molecules are useful in disease associated with NOVX. The polypeptides and nucleic acid molecules are useful in disease, Althrington's disease, and mucleic acid molecules are useful in disease, grack versus host disease, parking the preventing diseases or conditions, e.g. autoimmune disease, Althrington's disease, parking the parsaitic infections (many more diseases and diseases, yiral or because the proprise or percentines.) The 
or preventing diseases or conditions, e.g. autoimmune disease, Alzheimer's disease, diabetes, graft versus host disease, cancer or viral or bacterial infections.
                                                                                                                               Claim 2; SEQ ID NO 12; 342pp; English.

New NOVX polypeptides and polynucleotides, useful in diagnosing, treating or preventing diseases or conditions, e.g. autoimmune disease, Alzheimer's disease, diabetes, graft versus host disease, cancer or viral or bacterial infections.

Claim 2; SEQ ID NO 10; 342pp; English

The invention relates to an isolated NOVX polypeptide (of 44 disclosed) comprising its mature form, a sequence having at least 954 sequence identity to NOVX or a sequence comprising one or more conservative substitutions in the amino acid sequence of NOVX. Also included are a composition comprising NOVX and a carrier, a kit comprising, in one or more containers, the composition, a method of identifying an agent that binds to NOVX, a method for identifying a potential therapeutic agent for use in treatment of a pathology related to aberrant expression or aberrant physiological interactions of NOVX, a method for screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a method for modulating the activity of NOVX, a method for modulating the activity of NOVX, a sesociated with NOVX or a coll comprising the vector, an aisolated nucleic acid molecule, a cell comprising the vector, an antibody that immunospecifically binds to NOVX, a method for determining the presence of or or predisposition to a disease associated with altered levels of expression of NOVX or the nucleic acid molecule in a sample, a method for determining the presence or amount of NOVX or the nucleic acid molecule in a sample, a method for determining the presence of or predisposition to a disease associated with altered levels of expression of NOVX or the nucleic acid molecule in a first mammalian under conditions that lead to expression of the polypeptide). NOVX is useful in the mannifacture of a medicament for treating a syndrome associated with NOVX. The polypeptides

The invention relates to a novel method for determining if a nucleic acid is a marker for a predetermined phenotype/cell type of interest from a biological species. The method comprises performing a global comparison of a group of expressed sequence tage (ESTB) known to be expressed in the phenotype/cell type of interest with all ESTB expressed in normal tissue in order to identify ESTB that are preferentially expressed in the phenotype/cell of interest. A method of the invention is useful for determining whether a nucleic acid is a marker for a predetermined phenotype or cell type of interest from a biological species, preferably arabidopsis or human. The cell type of interest is an abnormal cell such as a tumour cell, and the predetermined phenotype is a stress-induced component of the invention is also useful for determining the progression of colon of the invention is also useful for determining the progression of colon cancer in a human, for detecting a tumour cell, and for regulating or
                                                                                                                                                                                                                                          ö
and nucleic acid molecules are useful in diagnosing, treating or preventing diseases or conditions, e.g. autoimmune disease, Alzheimer's disease, stroke, allergies, Parkinson's disease, Huntington's diseases, multiple sclerosis, anxiety, pain, diabetes, graft versus host disease, pancreatitis, obesity, ulcers, anaemia, cancer, viral or bacterial and parasitic infections (many more diseases and disorders are listed in the specification). The present sequence represents a NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           expressed sequence tag; EST; arabidopsis; tumour; phenotype; hyperosmotic stress; colon cancer; immunogen;

This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to constant and the encoded proteins thereof. Specifically, it refers to constant and activities are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as attibodies, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the cDNA molecules. As such, these conditions are useful for diagnostic markers or therapeutic targets for molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, neurological disease, Alzheimer's disease, Parkinson's disease, dementia, short memory and various cancer's as well as for maintaining equilibrium of sense or motor function, and for treating emotional reaction, fear response and panic. Accordingly, they exhibit osteopathic, neuroprotective, nootropic, antiparkinsonian, cytostatic and tranquiliser activities. This polypeptide is a protein
                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New 1995 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers
preventing the growth of a tumour cell. An antibody of the invention is useful for detecting the absence or presence of peptides encoded by tumour-associated markers. A polypeptide of the invention is useful as a immunogen for vaccinating an animal. The present sequence represents a tumour-associated antigen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ë

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel human polynuclectide and the encoded polypeptide. A polynuclectide of the invention may have a use in gene therapy. An oligonuclectide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynuclectide or as a probe for detecting the polynuclectide. The polynuclectides ADM01316-ADM01316 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM013759-ADM06201 encoded by the polynuclectides are useful as pharmaccutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotides and polypeptides are useful in gene therapy, developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy.
                                                                                                                                                                                                       human; gene therapy; diagnostic marker; pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             69.5%; Score 41; DB 7; 170.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated polynuclectide and the encoded polypeptide. The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cytostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoletic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic protein of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Z, Ma Y;

The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a prointeration of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid mucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the autisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound a activity; (11) a culture compusing strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of product is overexpressed or underexpressed; (12) determining the extent or which each of the strains is present in a culture or collection of proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids are useful for for extending dentifying proteins or screening for homologous nucleic acids required for proliferation to the solate candidate model acids are useful for a dentifying in a proving mucleic acids are useful for a dentifying an antisense or its endidate acids are useful for a compound and acids are useful 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to an isolated nucleic acid compitising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibitied by the artisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibitied by the capable of proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for the proliferation or the activity of a gene in an operon required for capable of a gene product lies of a gene or which the test compound that inhibits arollferation of an organism the test compound that inhibits arollferation of an organism acts; (9) manufacturing an antibiotic; (10) prolification of an organism acts; (9) manufacturing an antibiotic; (10) prolification of an organism. The authore comprising strains in which the each of the strains is present in a culture or collection of compound the acids are useful for proliferation of an organism. The anticense nucleic acids required for proliferation no isolate candidate molecules for rational dentifying protein or organism. The anticense nucleic acids are useful for proliferation of an organism. The arisense nucleic acids are useful for proliferation in cells other than S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Wipp. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense nucleic acids, useful for identifying proteins or screening
                                                                                                                                                                        Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Zyskind JW;

the 6113 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid;

(2) a host cell containing the vector; (3) an isolated a nucleic acid; (4) a host cell containing the vector; (3) an isolated a nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway in eque proliferation, or that inhibits cellular proliferation (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation or the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a compound that inhibits proliferation of an compound; a activity; (11) a culture comprising strains in which the gene compound; the compound; a compound; a compound; a compound; a confidence is oversxpressed; (12) determining the extent to the compound; and extent the compound; and extent the compound; and extent the compound of an only of the compound; and other spressed; (12) determining the extent to the compound of the compound; and other spressed; (13) and other spressed; (14) and other spressed; (15) determining the extent the compound of

drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, tk. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid comprising any one of the 613 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Zyskind JW;

Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                   drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent din not form part of the printed specification, but was obtained in electronic format directly from MIPO at from the printed specification, but was obtained ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.
pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational

Sequence 424 AA;

```
The invention relates to a non-naturally occurring peptide of Mycobacterium tuberculosis comprising an amino acid sequence corresponding to an anion pump protein. The invention also relates to a non-naturally occurring nucleic acid corresponding to a DNA sequence of Mycobacterium tuberculosis or Mycobacterium tuberculosis or Mycobacterium leprae or for screening for new tuberculosis or Mycobacterium leprae or for screening for new tuberculosis drugs. Purified proteins derived from the sequences of the invention may elicit a specific immune response. The peptide may also be used to detect hypersensitivity reactions of individuals exposed to Mycobacterium tuberculosis or Mycobacterium leprae. The proteins and peptides may be affixed to solid supports to detect antibodies typical of hypersensitivity reactions, from a patient's sera. This sequence represent Mycobacterium tuberculosis non naturally occurring peptide of the invention. Note: The sequence date of the this patent did not form part of the printed specification but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present sequence is the protein sequence of novel secreted protein PbSR from the mouse malaria parasite, Plasmodium berghei. The invention PbSR from the mouse malaria parasite, Plasmodium faloriparum (CFSR), P. berghei (PbSR) and Plasmodium yoelli (PbSR) that are post-translationally modified in sporozoites. These include Limulus clotting factor, lipid binding, scavenger receptor cysteine-rich and pentraxin domains. Homologues were identified in Plasmodium knowlesi (PkSR), Cryptosporidium parvum (CpSR), Toxoplasma conting condii (TgSR) and Theileria parva (TpSR). PbSR, PfSR and PySR are from a unique and previously unrecognized family containing domains associated with binding and modulating host proteins involved in immunity. They are the first proteins from Plasmodium which are secreted and which show a can estimate involved in immunity. They are the first proteins from Plasmodium which are secreted and which show a can estimate and mosquito, making them highly useful for the production of malaria vaccines. Transgenic PbSR null mutants have attenuated growth in immunocompetent mice. They fail to produce sporozoites in Anopheles stephensi mosquitoes and consequently are dead-end parasites in Anopheles stephensi mosquitoes and consequently are dead-end parasites in the midgut of the mosquitoe and consequently care dead-end parasites in the midgut of the mosquitoe, are used in vaccine compositions. Agents capable of antagonising, inhibiting or incerfering with the function or expression of the secreted protein are used in the treatment and/or prophylaxis of malaria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New secreted proteins from malarial parasites (e.g. Plasmodium falciparum), useful for detecting or diagnosing malaria, or as a vaccine or medicament for the treatment and/or prophylaxis of malaria.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present sequence is a serine protease designated BSSP-3, which is isolated from human brain tissue. Transformants may be used to produce the enzyme or its partial sequences. Products from the present invention are used for screening for potential peptide or non-peptide serine protease inhibitors or expression regulators for use as drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New serine protease expressed in brain tissue - used in screening for potential serine protease inhibitors for drug use.
                                                                                                                            Serine protease; BSSP-3; brain tissue.

The invention provides novel modular secreted proteins from Plasmodium falciparum (PFSR), Plasmodium berghei (PbSR) and P. yoelii (PySR) that are post-translationally modified in sporozoites. These include Limulus clotting factor, lipid binding, scavenger receptor cysteine-rich and pentraxin domains. Homologues were identified in plasmodium knowlesi (PkSR), Cryptosporidium parvum (CpSR), Toxoplasma gondii (TgSR) and Theileria parva (TpSR), PbSR, PfSR and PySR are from a unique and previously unrecognized family containing domains associated with binding and modulating host proteins involved in immunity. They are the first proteins from plasmodium which are secreted and which show a gene disruption phenotype in both vertebrate and mosquito, making them highly useful for the production of malaria vaccines. Transgenic PbSR null mutants have attenmated growth in immunocompetent mice. They fail to produce sporozoites in Anophee stephensi mosquitos and consequently are desirable and parasites in the midgut of the mosquito.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Plasmodium proteins, and the nucleic acids encoding them, are used in claimed methods for the detection/diagnosis of malaria, and are also used in vaccine compositions. Agents capable of antagonising, inhibiting or interfering with the function or expression of the secreted protein are used in the treatment and/or prophylaxis of malaria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New secreted proteins from malarial parasites (e.g. Plasmodium falciparum), useful for detecting or diagnosing malaria, or as a vaccine or medicament for the treatment and/or prophylaxis of malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                               The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcome the minimal sample indicates the presence of soft tissue sarcome. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcome, possibly via gene therapy or vaccine production. The nucleic sarcd sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of polypeptides related to urological disorders, e.g. 44390, 54181, 211 or for identifying a compound capable of treating a urological disorder or identifying and treating a subject having a urological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also concompasses polypeptides 90% identical and polybuclecrides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens, and the use of ovarian antigens, antibodies against human ovarian antigens, and the use of ovarian polymuclecrides and polypeptides in diagnoshing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours for ovarian or breast origin, reproductive system clisorders (e.g., infertility, disorders or pregnancy, anovulation, adjacorders (e.g., infertility, disorders origin, reproductive system clisorders, infertility, disorders origin, troplosmorphy, and toxic disorders, infertility, immune disorders (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), chood-related disorders (e.g., anaemia), cardiovascular disorders (e.g., anaemia), cardiovascular disorders (e.g., anaemia), cardiovascular disorders on uniquen polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may also be used in screening for compounds which clearing and the polypeptides may be used as food additives or to prepare antibodies (e.g., entite) and entered and entered and entered and entered or prepare antibodies clearing and entered and entered or prepare antibodies entered and entered and entered or the printed entered and entered or the printed entered and entered or prepare antibodies entered in a passe obtained and entered or the printed or entered in entered in electronic form part of the printed entered in electronic 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by 2. The disorders include SAPHO syndrome (synovitis, acne, p. acnes. The disorders include SAPHO syndrome (synovitis, acne, 2. p. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the 2. C. presence or absence of P. acnes in a patient comprises contacting a cample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies con perceit for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and ctherefore treat P. acnes infections. The acnes prosence, for example, by cangentic agents for determining P. acnes presence, for example, by cangened in the famined specification, but was cobtained in electronic format directly from WIPO at the wipo.int/pub/published_pot_sequences

The invention relates to an isolated polynucleotide (ACF64435-ACF64733)
encoding a Propionibacterium acnes protein. The invention also relates to
polypoptides encoded by the polynucleotides. The invention also relates to
immunogenic fragments of P. acnes polypoptides. The invention
additionally encompasses expression vectors and host cells comprising a
polynucleotide of the invention, antibodies against polypoptides of the
invention, fuelon proteins comprising a polypoptide of the invention; a
cc polynucleotide of the invention, and an isolated T cell population comprising T cells prepared
cc invention, fuelon proteins composition (comprising P. acnes polypoptides,
contigen-presenting cells that express the polypoptide); a method and kit
cf or detecting or determining the presence or absence of P. acnes in a
cantigen-presenting cells that express the polypoptides, antibodies, fusion
cf or detecting or determining the presence or absence of P. acnes in a
cf patient; and a method for inhibiting the development of P. acnes in a
contient. The P. acnes polypoptides, polynucleotides, antibodies, fusion
cc patient; and a method for inhibiting the development of P. acnes in a
cc patient; and a method for inhibiting the development of P. acnes in a
cc patient; and a method for inhibiting the development of P. acnes in a
cc polypoptides are useful for diagnosing, preventing or treating acne
cc proteins. T cell populations or antigen-presenting or treating acne
cc protein. The polynucleotides can also be used as probes or primers for
cc nucleic acid hybridisation. The vaccine composition is useful for the
ct stimulation of an immune response against P. acnes, or for treating acne,
cand the kit is useful for performing a diagnostic assay. The present
creading frame) contained within the P. acnes polynucleotides of the
cinvention. Note: The sequence data for this patent did not form part of
the printed specification, but was obtained in electronic format directly

the Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders of digestive system, particularly cancer and cancer metastases.

Claim 11; SEQ ID NO 1284; 986pp; English

The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the

cancer related proteins, and polynucleotide acquences encoding them. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of the colon and/or rectum, including colorectal cancer, colorectal cancer metastases, and gastrointestinal disorders such as dysphagia, peptic oesophagitis, gastric reflux, irritable bowel syndrome, and peritoneal diseases. The invention also describes antibodies that bind colorectal cancer related proteins, vectors, host cells, and recombinant and synthetic methods for producing human colorectal cancer related polynucleotides, polypeptides, and/or antibodies. Ass3761-As869763 represent human colorectal cancer related proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site at sequata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                             New colorectal cancer polypeptide for diagnosing, prognosing, preventing, and treating immune, hyperproliferative, liver, kidney, reproductive disorders and for identifying modulators of therapeutic use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human; colorectal cancer; antigen; gene therapy; infection; cancer; intestinal disorder; inflammatory disease; infection; cancer; intestinal neoplasm; small intestine carcinoid tumour; small intestine neoplasm; small bowel lymphoma; ulcer; peptic ulcer; Bruton's disease; X linked infantile agammaglobulinaemis; peptic ulcer; Bruton's disease; X linked infantile agammaglobulinaemis; hyperproliferative disorder; acute lymphoblastic leukaemia; acute lymphocytic leukaemia; urinary system disorder; carcinoid heart disease; arrhythmia; respiratory disorder; non-allergic rhinitis; sinusitis; musculoskeletal system disorder; Albers-Schonberg disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present invention relates to the isolation of novel human colorectal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides the protein and coding sequences of a number of colorectal cancer antigens. These are shown in AA157547-AA4135619 and AAM13569-AAM136641. These can be used in the diagnosis, prevention and treatment of cancer of the colon and/or rectum. The present sequence is a colorectal cancer antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the colon and rectum including colorectal cancers and also for testing and detection e.g. diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The invention relates to a colorectal cancer antigen. The antigen is useful for chromosome identification, chromosome mapping, radiation by the invention mapping or gene therapy, or as hybridisation probes for the inferential identification of the tissues or cell types present in a biological sample. The antigen is useful for treating, preventing, cliental ampler. The antigen is useful for treating, preventing, diagnosing and/or prognosing gastrointestinal disorders, including intestinal neoplasms (carcinoid tumour of the small intestine) and intestinal neoplasms (carcinoid tumour of the small intestine) and culcars (e.g. peptic ulcers). The antigen and its nucleic acid are useful corrovide immunological probes for differential identification of the tissue. The antigen and its nucleic acid are useful for treating, preventing, diagnosing and/or prognosing diseases, disorders and/or conditions of the immune system e.g. Bruton's diseases, X linked infantile agammaglobulinaemia, severe combined immunodeficiencies, DiGeorge anomaly, etc. The antigen and its nucleic acid is useful for treating, preventing and/or diagnosing hyperproliferative disorders (e.g. acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                       Novel colorectal cancer antigen useful for treating, preventing, diagnosing and/or prognosing gastrointestinal disorders, infections, cancers such as intestinal neoplasms, ulcers.
                                                                                                                                                                                                         Claim 11; SEQ ID NO 84; 179pp; English.

WPI; 2001-457740/49. N-PSDB; ABA08731 Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer

Claim 20; Page 201; 1963pp; English.

Sequences ABB10981-ABB12310 represent 1350 novel human polypeptides, and sequences ABA0825-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides.

Contibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the copential therapeutic applications. The polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence copential therapeutic applications. The polypeptides of the invention may chave various activities, including cytokine, cell proliferation or cell differentiation activities, stem cell growth factor activity; immunomodulatory activity; activine or injubin related activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolyvic activity; activine or injane activities; cancer cell proliferation or metastasis.

Conditions activities, receptor or ligand activities and nucleotides of involved in oncogenesis cancer cell proliferation or metastasis.

Conditions activities preventing, treating or ameliorating medical conditions are useful for preventing, treating or ameliorating medical cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell cancers, haematopoietic disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and replaced experiently medications in additions in additions in activity may be used in the treatment of viral, that can be used to augment or replace cells damaged by illness, autofmmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells polypeptide of the invention

```
The invention describes a new isolated nucleic acid encoding a Klebsiella phoumoniae polypetide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell
                                                                                                                                      New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for
preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a new isolated nucleic acid encoding a Klebsiella pheumoniae polypetide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae. This is the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.

comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the application, a method for identifying a compound that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound that regulates the activity is useful for more of the polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic form directly from WIPO at EDP. We wish the sequence of the prediction of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

The invention discloses a composition comprising two or more isolated rate or the invention discloses a composition comprising two or more isolated rate derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a compound to that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal competed to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for identifying a paperilection or more of the polypeptides given in the specification, a method for identifying a compound that regulates the activity in an animal of one or more of the polypeptides or their antibodies. The polynucleotide or the compound that compessition comprising the one or more polynucleotides or their antibodies. The polynucleotide or the compound that compessition comprising the one or more pain esquence presented is a human procein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form directly from WIPO at the printed the polynuclean of the polynuclean or the component of the polynuclean or more paperile at a sequence presented is a human procein (shown in Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endopthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  character and the proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrom (synoritis, acne, pustulosis, hypertosis and osteomyellis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central retroins system, however it is particularly involved in the inflammatory lesions system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

cncoding a Propionibacterium acnes protein. The invention also relates to encoding a propiotides acnosed by the polymucleotides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a colymoralcotide of the invention, antibodies against polypeptides of the invention, a comprising a polypeptide of the invention, and an isolated T cell population comprising T cells prepared to invention, this method; a vaccine composition (comprising P. acnes polypeptides, polymoral presenting cells that express the polypeptide; a method and will express the polypeptide; and will express the polypeptide; and will express the polypeptide; and an isolated T cell populations, or canigen-presenting cells that express the polypeptide; antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptide; antibodies, fusion proteins. T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne polypeptides, polypeptides, polymoralcotides, and the composition is useful for the solyment cells of an immune response against P. acnes, or for treating acne concleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne concleic acid hybridisation. The vaccine composition is useful for the sequence represents a polypeptide predicted to be encoded by an ORF (open creating frame) contained within the P. acnes polymoralcotides of the canding rame) contained within the P. acnes polymoralcotides of the creating a diagnostic assay. The present convention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.vubo.int/published_pot_eresponse agained for the printed specification, but was obtained i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antibacterial, fungicide, insecticide, polymorphism, genetic analysis, detection, food, gene expression; plant, animal; microorganism; toxin; antibiotic; biopesticide, virulence factor; disease model; plague;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                  The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the colypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that cresponse or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly roxins and carried antibacterials useful as insecticides, bartericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful are harped to proteins or antibiotics) and as the carry and fer identifying tragets of human diseases for which P. Luminescens and for identifying tragets of human diseases for which P. Luminescens and for identifying tragets of human diseases for which P. Luminescens and for identifying tragets of human diseases for which P. Luminescens and for a marginal and the proteins are as virulence than the containing the genes and the proteins are as virulence and carried and for identifying the carry and for a marginal and the proteins are as virulence than the carry and for a marginal and the proteins are as virulence and carried and for a marginal and the proteins and for a marginal and the proteins are as virulence and carried and for a marginal and the proteins are as virulence and carried and for a marginal and the proteins are a virulence and as a virulence and and an

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter. The invention also relates to a transformed plant a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant satisformed plant is a crop plant set or soybean. The method of producing a transformed plant having an improved property comprises transformed plant with the having an improved property comprises transformed plant with the polymuclectide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. Comproved plant properties, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or property and plant with the plant properties, by modification of photosynthesis or by properties in property.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                           New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; of acought tolerance; heat tolerance; pathogen tolerance; pathogen tolerance; pathogen tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; paterial polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61.0%; Score 36; DB 8; Length 466; 71.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAY79209;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 48
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ձ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant convention an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the copy, mucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress conduction. This sequence represents a bacterial polypeptide used in the scope of the printed specification but was obtained in electronic form of forms the form means.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                              New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Hio Y, Otsuka K, Nagai K, Irie R, Tamechika I;
Otsuka M, Nagahari K, Masuho Y;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM03316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Transferase; TRNSFS-1; human; antitumour; cancer; gastrointestinal disorder; developmental disorder; genetic disorder; neurological disorder; reproductive disorder; smooth muscle disorder; immunological disorder; inflammation; diagnosis; therapy; myristoyl CoA:protein N-myristoyltransferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

claimed novel human transferase proteins of the invention (see AAY79209-23). The sequence was deduced from a cDNA clone (see AAZ94201) isolated from a caecal tissue library. It shows homology to human myristoyl-CoA protein N-myristoyltransferase. TRNSF-1 is expressed in reproductive, nervous and smooth muscle tissues, especially those associated with cancer and inflammation. The new human transferase proteins and the polynucleotides encoding them can be used in the diagnosis, prevention

The present sequence is that of human transferase TRNSFS-1, 1 of 15

```
This invention relates to a method of differentially modulating the growth or differentiation of blood endothelial cells (BEC) or lymphatic endothelial cells with a composition comprising an agent that differentially modulates blood or lymphatic endothelial cells. Treating hereditary lymphoedema comprises identifying a human subject with lymphoedema and with a mutation in at least one allele of agene encoding a LEC protein, where the mutation correlates with lymphoedema in human subjects, and with the proviso that the LEC protein is not VEGFR-3; and administering to the subject a composition comprising a lymphatic growth agent selected from VEGF- Correspond to composition and polynucleotides. The invention may be useful for the development of compounds with an antiangiogenic, cytostatic, vascropic or antiinflammatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells or lymphatic endothelial cells, in treating hereditary lymphoedema, in screening for an endothelial cells, in treating hereditary predisposition to the disorder or in monitoring the efficacy or toxicity or a drug on endothelial cells. The agent is useful in manufacturing a medicament for the differential modulation of blood vessel endothelial cell or lymphatic vessel endothelial cell growth or differentiation. The

lymphatic growth agent may also be used in manufacturing a medicament for the treatment of hereditary lymphoedema resulting from a mutation in a LEC gene or of other diseases involving the lymphatic vessels, such as various inflammatory diseases and cancer metastasis via the lymphatic system. The present sequence is that of a human LEC/BEC differentially expressed protein which is related to the method of the invention.Note: This sequence does not appear in the specification but was obtained by the indexer using the source data given in table 14 of the specification.

New PRO polypeptides and polynucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral N-PSDB; ADP23806

Claim 7; SEQ ID NO 985; 2940pp; English

nervous system

The invention relates to a novel isolated nucleic acid and the PRO polypeptide encoded by it. A protein of the invention has antilnflammatory, antiarthritic, antirheumatic, immunosuppressive, osteopathic, antidiabetic, dermatological, antipsoriatic, antialergic, antisathmatic, hepatotropic, and respiratory activity. A polynucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its agonist, antagonist, or antibody that specifically binds to the polypeptide is useful for treating an immune related disorder such as systemic lupus exythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, a spondyloarthropathy, systemic sclerosis, an idiopathic inflammatory myopathy, Sjogren's syndrome, systemic vascultis, sarcoidosis, autoimmune haemolytic ansemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, a demyelinating disease of the central or peripheral nervous

system, idiopathic demyelinating polyneuropathy, Guillain-Barre syndrome, a chronic inflammatory demyelinating polyneuropathy, a hepatobiliary disease, infectious or autoimmune chronic active hepatitis, primary biliary cirrhosis granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease, gluten-sensitive enteropathy, Whipple's disease, an autoimmune or immune-mediated skin disease, a bullous skin disease, exthema, allergic rhinitis, atopic dermatitis, food hypersensitivity, urticaria, an immunologic disease of the lung, eosinophilic pneumonia, idiopathic pulmonary fibrosis, hypersensitivity pneumonitis, a transplantation associated disease, graft rejection or graft-versus-host disease. The present sequence represents a PRO protein of the invention.
